Dr. Brian E. Applegate is associate professor in the Department of Biomedical Engineering at Texas A&M University. Dr. Applegate's research interests include the development/validation of intravascular optical imaging for diagnosis/monitoring of atherosclerosis and the development/validation of optical imaging for diagnosis/monitoring of middle and inner ear disease.

He also works on the development of novel optical and molecular imaging technology with improved performance over current state-of-the-art techniques. The primary imaging modalities researched are optical coherence tomography, fluorescence lifetime imaging and photoacoustic microscopy.
