# Fault Current Signatures of DFIG Wind Turbines

Jorge Martinez Garcia

***Vestas***<sup>®</sup>

# Agenda

- Introduction
- Vestas DFIG types:
  - VRCC → Single line diagram & control
  - VCS → Single line diagram & control
- Generic VCS short circuit waveforms
- Examples of short circuit waveforms
- Conclusions
- Questions

# Introduction

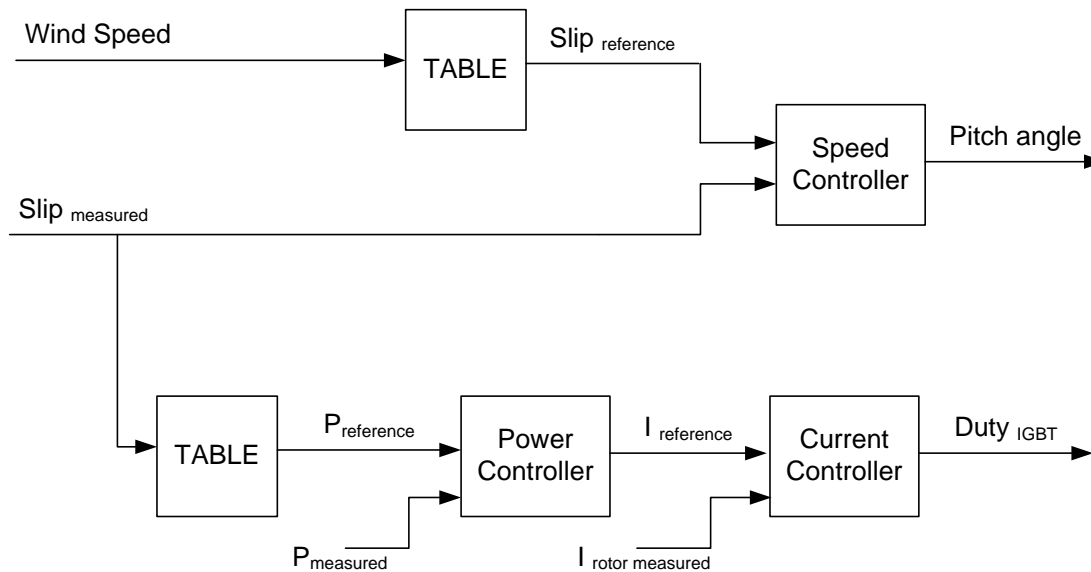

- High increase in the number of wind turbines installed:
  - Wind turbines topology differ from synchronous generators
    - Voltage control
    - Frequency control
    - **Short circuit contribution**
- For a reliable operation of the system the electrical grid should be adapted, at some degree, to the new wind turbines technologies
  - In this case; short circuit contribution from some wind turbine types could differ from synchronous generators

# DFIG types: VRCC

- Hardware

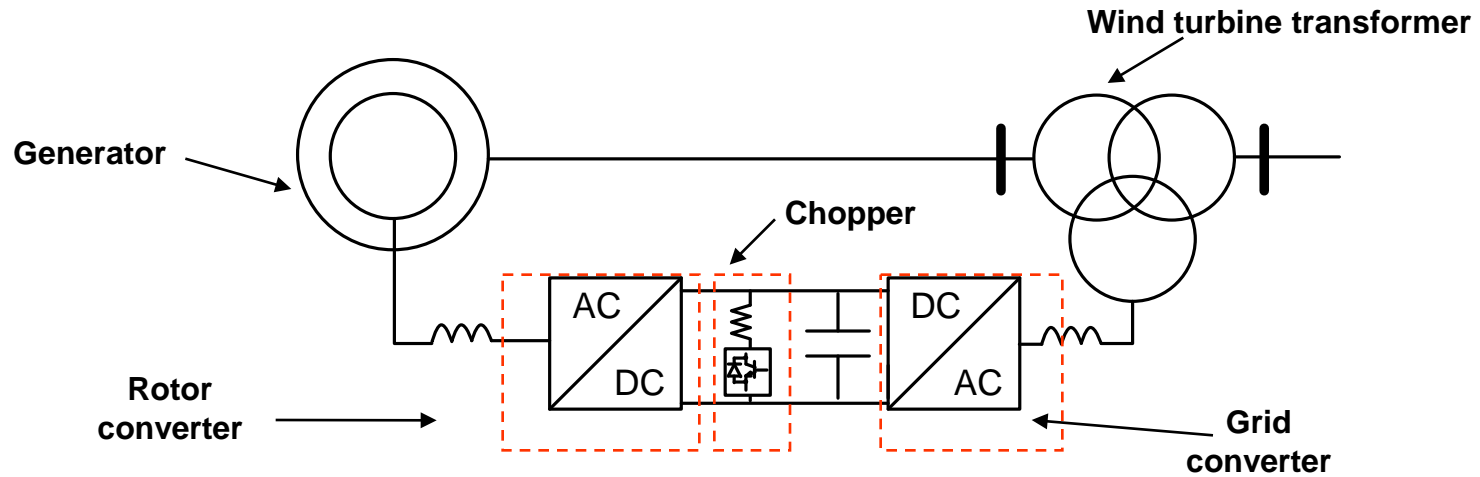

- Control

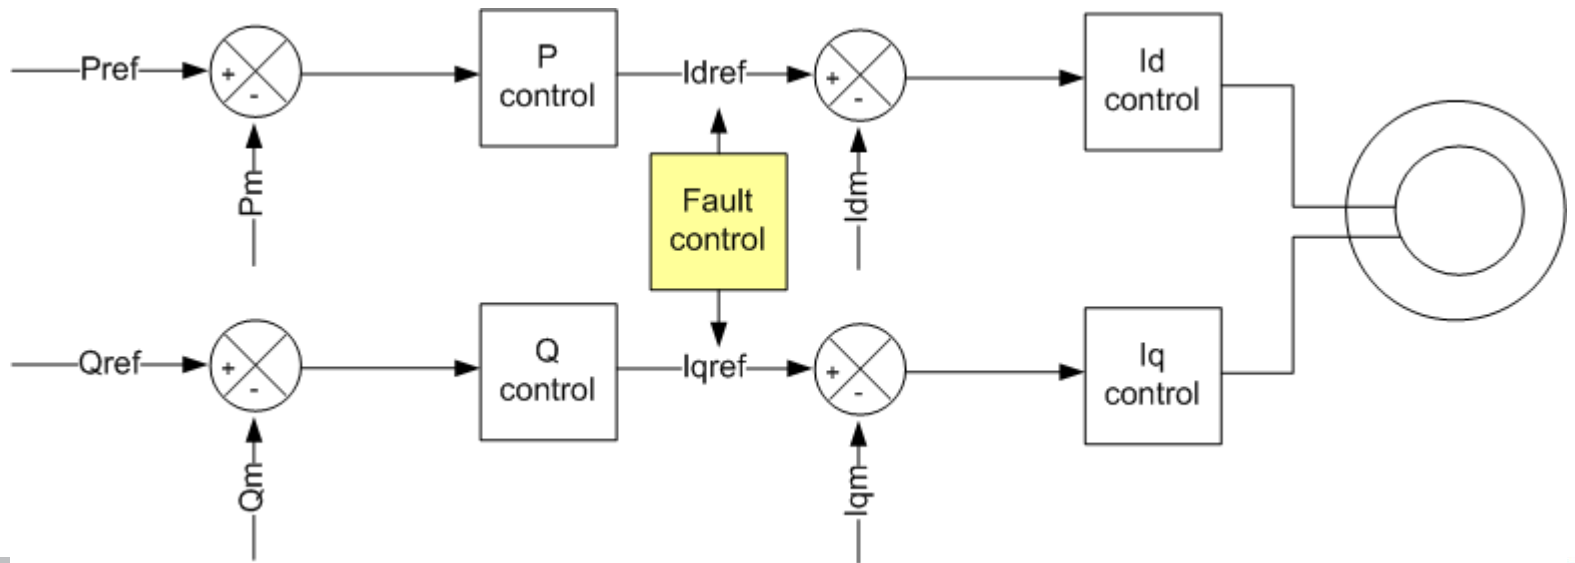

# DFIG types: VCS

- Hardware

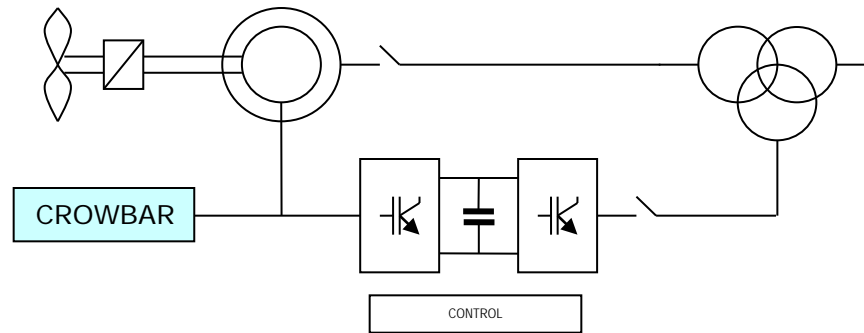

- Control of rotor converter

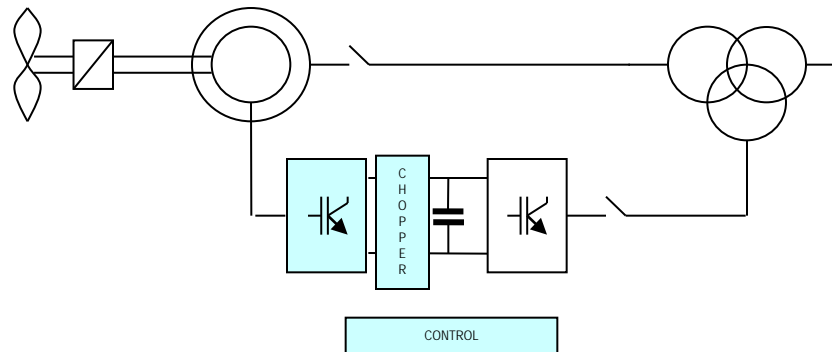

# DFIG: VCS

- IN THE PAST:  
INSTANTANEOUS DISCONNECTION OF THE DFIG TO PROTECT ELECTRONIC DEVICES

- NOWDAYS:

GRID SUPPORT  $\Rightarrow$   $\left\{ \begin{array}{l} \text{NO DISCONNECTION Grid Operator Voltage profiles} \\ \text{REACTIVE CURRENT SUPPORT} \end{array} \right.$

# DFIG: VCS

- Control during faults:

GRID SUPPORT  $\Rightarrow$

NO DISCONNECTION (Chopper control & protection settings)  
 REACTIVE CURRENT SUPPORT (current control)

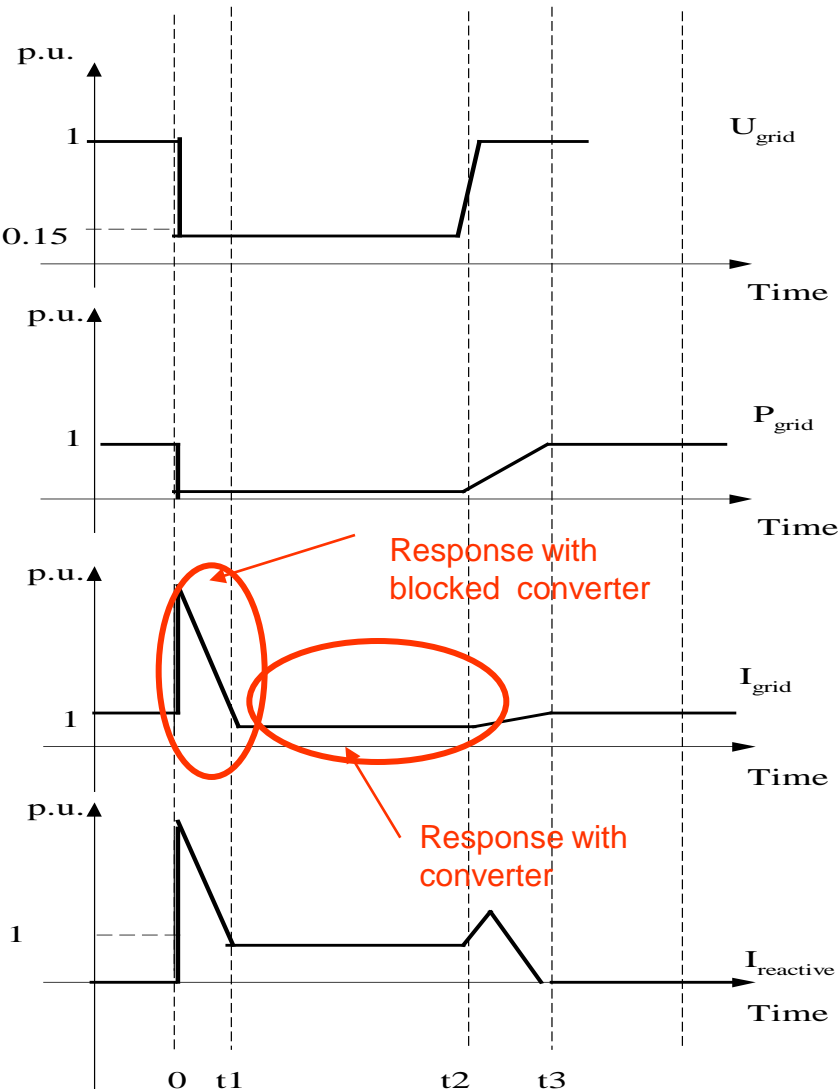

CHOPPER CONTROL:

CURRENT CONTROL:

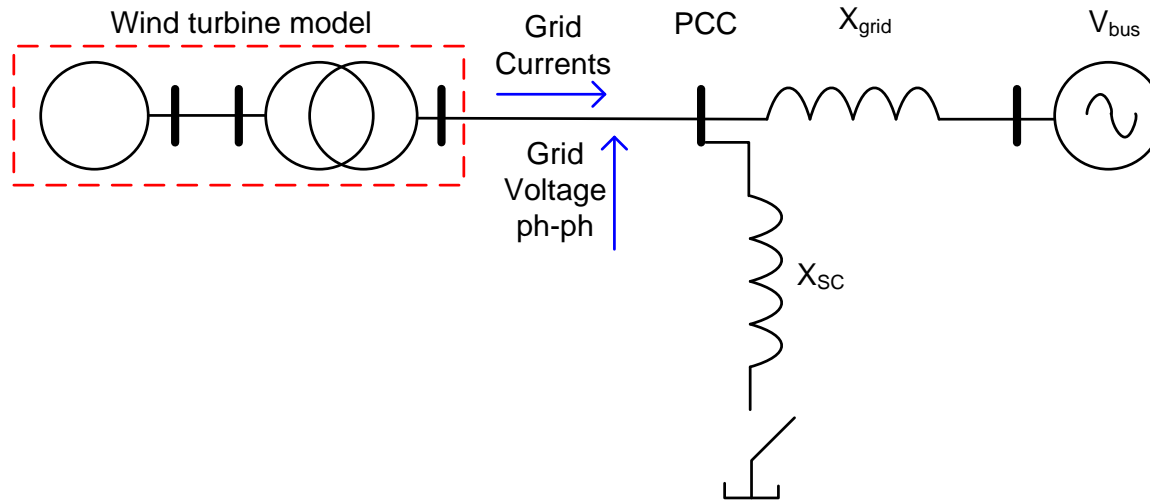

# GENERIC ABOUT VCS SHORT CIRCUIT CONTRIBUTION

1. Initial phase, the generator gives a large short circuit current (1 - 5 p.u.).
2. The rotor converter enters current control and starts supporting the grid.
3. During the fault, within the hardware constraints.
4. Turbine speed will increase during the fault. The stored kinetic energy is useful in order to give a fast contribution of active power to the grid when the fault is cleared.
5. As the voltages return to normal condition, the generator will reduce reactive current injection.
6. After voltage recovery normal power control is re-enabled and the power is ramped back in a controlled way.

# DFIG short circuit

- *Short-circuit simulation set up. VCS 2MW*

## Test Cases (Remaining Voltage at PCC)

0%

25%

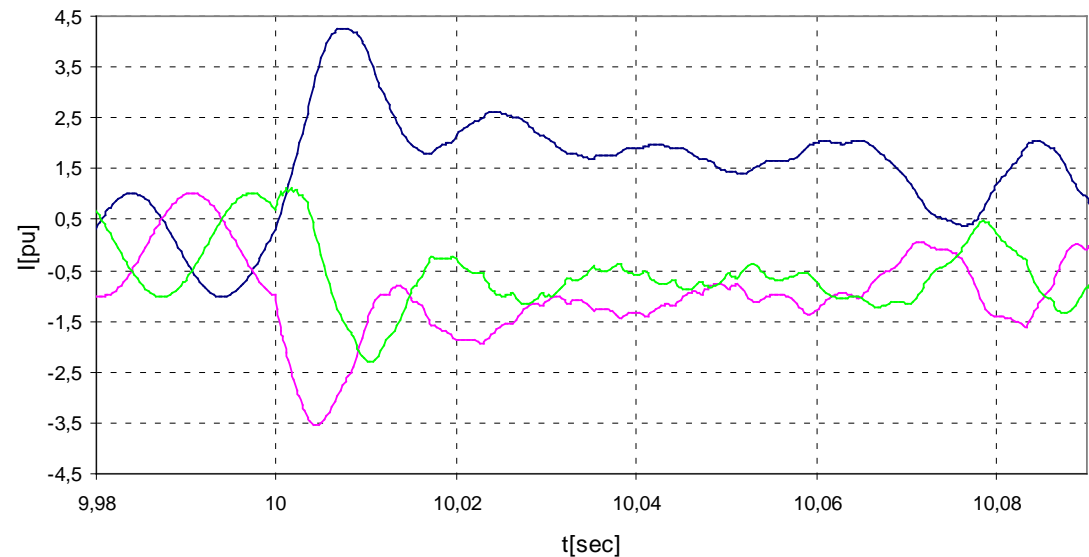

# DFIG short circuit

- **Short-circuit test waveforms. VCS 2MW, remaining voltage = 0%.**  
SYMMETRICAL FAULTS (200ms- 100% RATED POWER)

**Line-line voltage at MV transformer terminals**

**Currents in medium voltage side of turbine transformer.**

# DFIG short circuit response

- **Short-circuit test waveforms. VCS 2MW, remaining voltage = 25%.**  
SYMMETRICAL FAULTS (200ms- 100% RATED POWER)

**Line-line voltage at MV transformer terminals**

**Currents in medium voltage side of turbine transformer.**

# Algorithm use in the next figures:

## 16 s/cycle full cycle cosine filter

The filter coefficients

$$\text{CFC}_n = \cos\left[\frac{2\pi}{16} \cdot n\right] \quad (1)$$

The Cosine filter

$$\text{IX}_{\text{smp}l+\text{spc}} = \frac{2}{N+1} \sum_{n=0}^N \text{I}_{\text{smp}l+\text{spc}-n} \text{CFC}_n \quad (2)$$

The phasor magnitude

$$|\text{Io}|_{\text{smp}l+\text{spc}} = \sqrt{\left(\text{IX}_{\text{smp}l+\text{spc}}\right)^2 + \left(\text{IX}_{\text{smp}l+\text{spc}-\frac{\text{spc}}{4}}\right)^2} \quad (3)$$

The phasor output

$$\text{Io}_{\text{smp}l+\text{spc}} = \text{IX}_{\text{smp}l+\text{spc}} + j \cdot \text{IX}_{\text{smp}l+\text{spc}-\frac{\text{spc}}{4}} \quad (4)$$

where:

- $N$  = 15
- $n$  = 0, 1, 2, ...,  $N$
- $\text{smp}l$  = sequence of samples 0, 1, 2, 3, .....
- $\text{spc}$  = number of samples per cycle (16)
- $\text{I}_{\text{smp}l+\text{spc}-n}$  = Current samples
- $\text{IX}_{\text{smp}l+\text{spc}}$  = Filter output
- $\text{Io}$  = filter derived current phasor

paper by: Stanley E. Zocholl and Gabriel Benmouyal,  
Schweitzer Engineering Laboratories, Inc.

# Analysis of current following fundamental extraction

- **Short-circuit test waveforms. VRCC 1.8MW, remaining voltage = 0%.**  
SYMMETRICAL FAULTS (200ms- 100% RATED POWER)

Turbine voltages, phase-ground.

phase currents as recorded (blue)  
processed (red).

phase current envelope as recorded (green)  
processed (black, magenta).

# Analysis of current following fundamental extraction

- **Short-circuit test waveforms. VRCC 1.8MW, remaining voltage = 25%.**  
SYMMETRICAL FAULTS (300ms- 100% RATED POWER)

**Turbine voltages, phase-ground.**

**phase currents as recorded (blue)  
processed (red).**

**phase current envelope as recorded (green)  
processed (black, magenta).**

# Affection to the relays setting when using fundamental component extraction

Example distance relay characteristic:

- Lower fundamental current will lead to higher Z
- Relays at stations, could not have an optimal operation in distinguish protective zones
- DFIG Wind power plants with dedicated line connection: overcurrent relaying line protection

## **Conclusions:**

- **DFIG short circuit response quite different from Synchronous generators**
- **Low AC component exhibit during faults**
- **Affection to the relays setting when using fundamental component extraction**
- **No zero crossing for several cycles**
